Nothing shocks me. I'm a scientist.

INDIANA JONES
Vaccines are our proven best defense against viruses

• Vaccination mobilizes the host immune system to prevent virus infections
  - Immune memory

• Vaccination breaks the chain of transmission
Vaccines stimulate a protective immune response

- **Initial immune response**: Antibody prevalence and T cell number increase over time.
- **Protective immunity**: Antibody and T cell levels remain high, offering protection.
- **Immunological memory**: Antibody response is reactivated upon reinfection, providing long-term immunity.

- **First infection**: Antibody and T cell numbers increase and then decrease.
- **Mild or inapparent reinfection**: Antibody levels rise significantly, indicating reactivation of memory cells.
• Jenner, 1796

• Pasteur, 1885 - rabies vaccine; introduced the term vaccination from *vacca* (Latin, cow) in honor of Jenner

• Yellow fever, influenza vaccines - 1930s
Large-scale vaccination campaigns can be successful.
Vaccines are now an integral part of our existence

• We immunize children, adults of all ages, domesticated and wild animals

• Because of immunization, many childhood diseases are rare

• Vaccines are a major part of the First World’s public health measures, but not the Third World (e.g. rubella, measles)
How vaccines work in the real world

- Maintenance of a critical level of immunity
- Herd immunity
Herd Immunity

- Virus spread stops when the probability of infection drops below a critical threshold
- The threshold is virus and population specific
- Smallpox: 80 - 85%
- Measles: 93 - 95%
- No vaccine is 100% effective
- When 80% of population is immunized with measles, 76% of population is immune
Public complacency is dangerous to any vaccine program

- “Viral diseases are a thing of the past”
- “Polio is long gone”
- “I never get the flu”
- “Measles is just a trivial kid’s disease”
- “Chicken pox only affects kids”
- “Kids should get infected naturally”
- “I'm not injecting anything into my body”
- “Vaccines make you sick, they cause autism, they cause multiple sclerosis, etc etc”
- “I know a guy who got the flu shot and then got the flu”
- “I can’t afford to immunize my kids”
- “I don’t have time this year”

When these attitudes prevail, society has serious problems with large-scale vaccination programs
Vaccine programs depend on public acceptance of their value

The senior pastor of Eagle Mountain International Church in Newark Texas, had been critical of measles vaccination, and at least 12 people infected in the congregation did not receive the vaccine.

23 measles cases were reported in a largely unvaccinated Hare Krishna community in Stokes County, North Carolina.

All 58 measles cases reported in an outbreak in Brooklyn, New York, involved unvaccinated members of an Orthodox Jewish community.

Cases not tied to religious communities

Cases tied to unvaccinated members of religious communities

States with confirmed measles cases

Number of reported measles cases

50

1
Herd immunity:

1. Demonstrates the importance of immunizing livestock
2. Emphasizes that not everyone must be immune to protect a population
3. Emphasizes that everyone must be immune to protect a population
4. Describes how group-think can dominate anti-vaccine choices
5. All of the above
Vaccines can be *active* or *passive*

- **Active** - instilling into the recipient a modified form of the pathogen or material derived from it that induces immunity to disease
  - *Long term protection*

- **Passive** - instilling the products of the immune response (antibodies or immune cells) into the recipient
  - *Short term protection*
A natural passive vaccine
Zmapp, the best known passive vaccine

- Raised in mice immunized with virus-like particles
- Chimerized into human IgG1 scaffold
- Produced in tobacco plants
Passive therapy with convalescent serum

- Jordi Casals infected himself with Lassa virus at Yale in 1969
- Transfused with blood from nurse (Penny Pinneo) who had survived Lassa fever
Requirements of an effective vaccine

• Induction of an appropriate immune response
  - Th1 vs Th2 response

• Vaccinated individual must be protected against disease caused by a virulent form of the specific pathogen
  - Just getting ‘a response’ is not enough (e.g. producing antibodies)
Requirements of an effective vaccine

- Safety: no disease, minimal side effects
- Induce protective immunity in the population
- Protection must be long-lasting
- Low cost (<$1, WHO); genetic stability; storage considerations; delivery (oral vs. needle)
### Viral vaccines licensed in the US

</tbody>
</table>
Inactivated vaccines

- Chemical procedures (e.g. formalin, β-propiolactone, nonionic detergents)
- Infectivity is eliminated, antigenicity not compromised
Poliomyelitis

- Polio (grey), myelon (marrow) = Greek
- itis (inflammation of) = Latin

- “A common, acute viral disease characterized clinically by a brief febrile illness with sore throat, headache and vomiting, and often with stiffness of the neck and back. In many cases a lower neuron paralysis develops in the early days of illness”

Inactivated poliovirus vaccine, IPV

- Poliovirus treated with formalin to destroy infectivity
- 1954: National Foundation for Infantile Paralysis-sponsored clinical trial of Jonas Salk’s IPV, 1,800,000 children
- >50% protection, results announced 12 April 1955, licensed same day
Influenza virus

Three types: A, B, C

- HA (hemagglutinin)
- NA (neuraminidase)
- M2 (ion channel)
- M1 (matrix protein)
- Lipid bilayer
- 8 RNPs (-) strand RNA
- RNA polymerase
- NP (nucleocapsid protein)

Three types: A, B, C
Inactivated influenza vaccine

- 3000-49000 deaths/yr in US due to influenza virus
- Vaccine: virus grown in embryonated chicken eggs, formalin-inactivated or detergent or chemically disrupted virions
- 75-100 million doses manufactured each year US
- 60% effective in healthy children and adults <65 yr
- Protection correlates with serum antibodies to HA, NA
- Vaccine produced in cell culture avoids egg allergies (Flucelvax)
Inactivated influenza vaccine

- Envelope proteins change each year; new strains must be selected in the first few months for manufacture
- Use reassortants with most RNA segments from high-yielding strain, HA, NA from selected strain
- 2015-16 vaccine: A/California/7/2009 (H1N1); A/Switzerland/9715293/2013 (H3N2); B/Phuket/3073/2013; B/Brisbane/60/2008

§US Food and Drug Administration
Antigenic drift: Influenza virus
Go to:

m.socrative.com
room number: virus

Which statement about inactivated viral vaccines is incorrect:

1. Chemicals can be used to inactivate infectivity
2. They do not replicate
3. They can be dangerous if inactivation is not complete
4. Antigenic variation can make them ineffective
5. None of the above are incorrect
Subunit vaccines

- Break virus into components, immunize with purified components
- Clone viral gene, express in bacteria, yeast, insect cells, cell culture, purify protein
- Antigen usually a capsid or membrane protein
Flublok

Baculovirus Expression Vector System (BEVS) Technology

- **Baculovirus**: Engineer to express recombinant protein under powerful promoter
- **expressSF+ cells**: Infect cells in fermenter, Low-cost serum-free media
- **Pure protein**: Purify protein, Formulate with PBS into vaccine

Approved for 18-49 years old
Some successful subunit vaccines

*Cancer vaccine*

- Hepatitis B virus (HBV) - HBsAg protein produced in yeast
- Assembles into empty particles
Human papillomavirus vaccines

Cancer vaccines

- Gardasil (Merck): types 6, 11, 16, 18 produced in S. cerevisiae
- Gardasil-9 (Merck): types 6, 11, 16, 18, 31, 33, 45, 52, 58
- Cervarix (GlaxoSmithKline): types 16, 18 produced in insect cells
Future influenza vaccines?

- Virus-like particles: synthesis of HA alone in cells leads to production of immunogenic particles.
- Has also been done in plants.
- 1 square meter of plants produces 20,000 doses at under $0.20/dose.

Subunit vaccine pro and con

- **Advantages of a modern subunit vaccine**
  - *Recombinant DNA technology*
  - *No viral genomes or infectious virus*

- **Disadvantages**
  - *Expensive*
  - *Injected*
  - *Poor antigenicity*
Inactivated and subunit vaccines have a common problem

- Viral proteins don’t replicate or infect
- Don’t send out ‘danger signal’ to the immune response
- Pure proteins often require *adjuvant* to mimic inflammatory effects of infection
Adjuvants

• Stimulate early processes in immune recognition

• Produce a more robust acquired immune response with less antigen
  - Slow release of antigen as site of inoculation
  - Inflammation

• Licensed
  - Alum (aluminum hydroxide or phosphate; in HBV vaccine) - US
  - AS04 in Cervarix (alum, monophosphoryl lipid A, TLR4 ligand) - US
  - MF59 - squalene oil-in-water emulsion (depot, innate stimulatory) - Europe
New vaccine technologies

Microneedle patch

Thermostabilization in silk (or sugars)
Universal influenza vaccine

- Broadly neutralizing human mAbs
- Prime-boost
- HA stem antigen
What are some requirements for an effective vaccine?

1. Low cost
2. Ease of administration
3. Provides long lasting immunity
4. Minimal side effects
5. All of the above
Replication competent, attenuated vaccines

- Viral replication occurs, stimulates immune response
- Infection induces mild or inapparent disease
Empirically derived attenuated vaccines

Pathogenic virus is isolated from a patient and grown in human cultured cells → The cultured virus is used to infect monkey cells → The virus acquires many mutations that allow it to grow well in monkey cells → The virus no longer grows well in human cells and may be a candidate for a vaccine
FluMist

- Replication competent, intranasally administered influenza vaccine
- Multivalent
- Reassortants of master donor strain - HA, NA genes from current strains
- Viruses are cold-adapted, temperature-sensitive, and attenuated in a ferret model
- Replicate only in nasopharynx, produce protective immunity
Sabin oral poliovirus vaccine

Principles of Virology, ASM Press
Attenuation of poliovirus neurovirulence

Albert Sabin’s three strains of OPV licensed in the US in 1961
### Determinants of Sabin vaccine strain attenuation

Reported Cases of Paralytic Poliomyelitis, United States, 1961-2003

switch to IPV

1 paralytic case/1.4 million doses
Eradication of poliomyelitis

1988 WHA Resolution

2000 Stop poliovirus transmission

2005 Certify Global Eradication

2005-2010 Stop polio immunization
Can viral diseases be eradicated?

- Smallpox eradication program launched 1967, eradicated 1978
- Two features essential for eradication:
  - Replication in only one host
  - Vaccination induces lifelong immunity
Wild Poliovirus & cVDPV Cases\textsuperscript{1}, 2016
01 January – 05 April

\textsuperscript{1}Excludes viruses detected from environmental surveillance.

Even if we eradicate a virus from the earth, as long as the nucleotide sequence is known...
Engineering attenuated vaccines

- Yellow fever: first human virus identified, 1901
- Mosquito transmitted flavivirus
- Disease: fever and nausea to failure of major organ systems; high fatality
- Yellow fever vaccine 17D produced 1938 by 176 passages of virulent wild type Asibi strain in chick embryo tissue
- 500 million doses distributed; safe, effective
Building on success of YF 17D vaccine

Replace with dengue virus
Dengvaxia

- E, prM of dengue virus 1, 2, 3, 4 in YF 17D backbone
- Licensed in Mexico, Brazil, Philippines
- No protection against DENV-2
- Lead to worse disease in 2-9 yo
• Tetravalent, attenuated dengue virus vaccine produced by mutagenesis of infectious clone
• One dose, 100% protection vs challenge
• Route for Zika virus?
