What is a virus?

Lecture 1
Biology W3310/4310
Virology
Spring 2016

"There is an intrinsic simplicity of nature and the ultimate contribution of science resides in the discovery of unifying and simplifying generalizations, rather than in the description of isolated situations - in the visualization of simple, overall patterns rather than in the analysis of patchworks"

Viruses help form biofilms

17 DECEMBER 2015

Bacteria frequently grow in communities called biofilms, which are aggregates of cells and polymers. An example of a biofilm is the dental plaque on your teeth. Biofilms are medically important as they can allow

bacteria to persist in host tissues and on catheters, and confer increased resistance to antibiotics and dessication. Therefore understanding how biofilms form is crucial for controlling microbial infections. An advance in our understanding of biofilms formation is the observation that filamentous phages help them assemble, and contribute to their fundamental properties.

Pseudomonas aeruginosa is an important human pathogen which is a particular problem in patients with cystic fibrosis. The ability of this bacterium to form biofilms in the lung is linked to its ability to cause chronic infections. Pseudomonas aeruginosa biofilms contain large numbers of filamentous Pf bacteriophages (pictured; image credit). These viruses lyse cells and release DNA, which becomes one component of the biofilm matrix.

Mixing supernatants of P. aeruginosa cultures with hyaluronan, which is present in airways of cystic fibrosis patients, resulted in the formation of a biofilm - in the absence of bacteria. A major component of P. aeruginosa biofilms was found to be Pf bacteriophages. When purifed Pf bacteriophages were mixed with hyaluronan, biofilms formed. Similar biofilms also formed when the filamentous bacteriophage fd of E. coli was mixed with hyaluronan. Mixtures of Pf bacteriophages and various polymers (alginate, DNA, hyaluronan, polyethylene glycol) formed liquid crystals (matter in a state between a liquid and a solid crystal).

Pf phages were detected in sputum from patients with cystic fibrosis, but not in uninfected patients. Addition of Pf phage to sputum from patients infected with P. aeruginosa made the samples more birefringent, a property of liquid crystals

TWiV 368: Infected, you will be

December 20, 2015

Hosts: Vincent Racaniello, Alan Dove, Rich Condit, and Kathy Spindler

A plaque of virologists explores the biology of Zika virus and recent outbreaks, and the contribution of a filamentous bacteriophage to the development of biofilms.

room number: virus

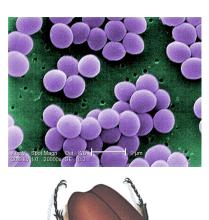

Which of the following is true?

- 1. Viruses are bacteria
- 2. Antibacterials can be used to treat viral infections
- 3. Antibiotics can be used to treat viral infections
- 4. Antivirals can be used to treat bacterial infections
- 5. None of the above

We live and prosper in a cloud of viruses

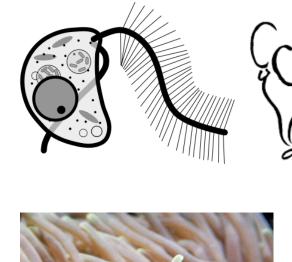

- Viruses infect all living things
- We eat and breathe billions of virions regularly

We carry viral genomes as part of our own genetic material

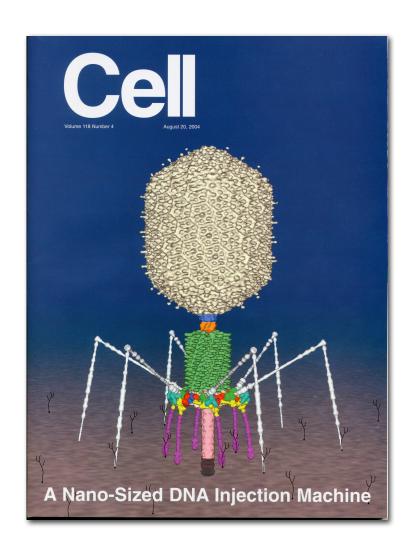

The number of viruses on Earth is staggering

More than 10³⁰ bacteriophage particles in the world's waters!

• A bacteriophage particle weighs about a femtogram (10⁻¹⁵ grams)

10³⁰ X 10⁻¹⁵= the biomass on the planet of BACTERIAL VIRUSES ALONE exceeds the biomass of elephants by more than 1000-fold!

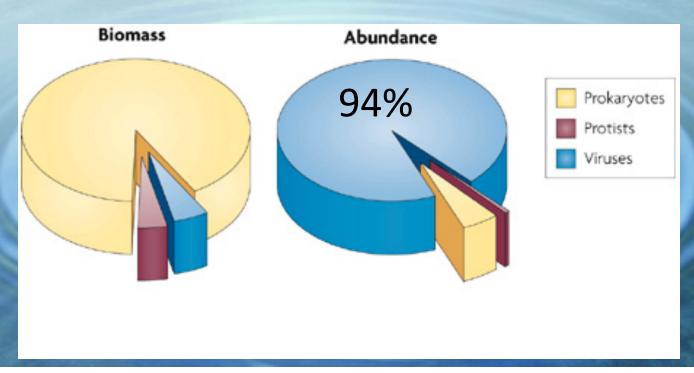

•The length of a head to tail line of 10³⁰ phages is 100 million light years!

http://www.phagehunter.org/2008/09/how-far-do-those-phages-stretch.html

Viruses are not just purveyors of bad news

More viruses in a liter of coastal seawater than people on Earth

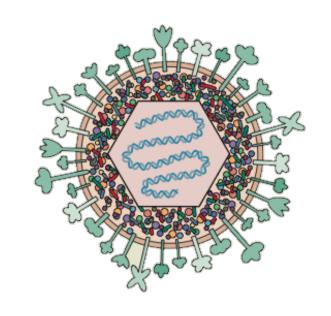

There are ~10¹⁶ HIV genomes on the planet today

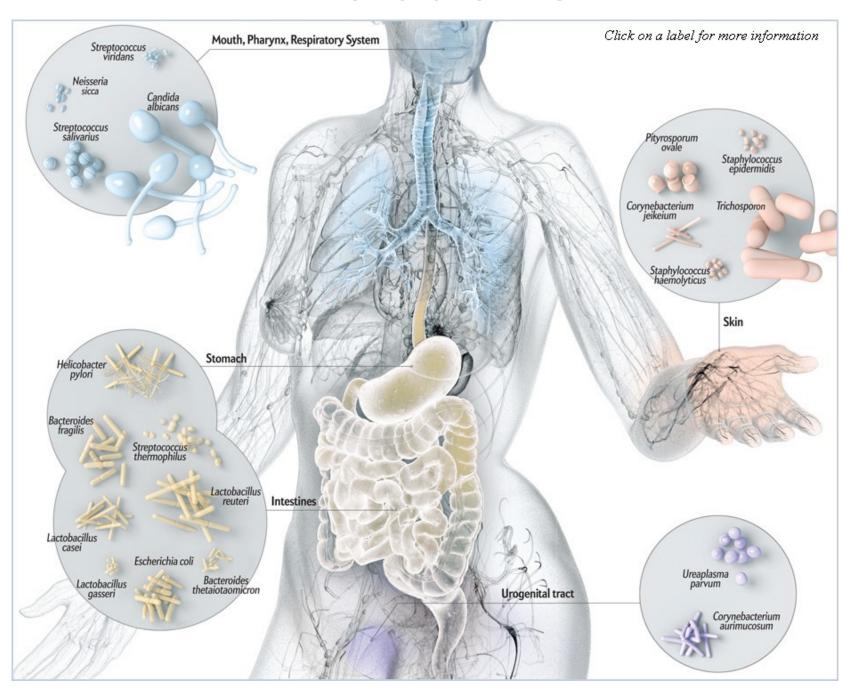

How 'infected' are we?

- HSV-1, HSV-2, VZV, HCMV
 EBV, HHV-6, HHV-7, HHV-8
- Once infected, it is for life

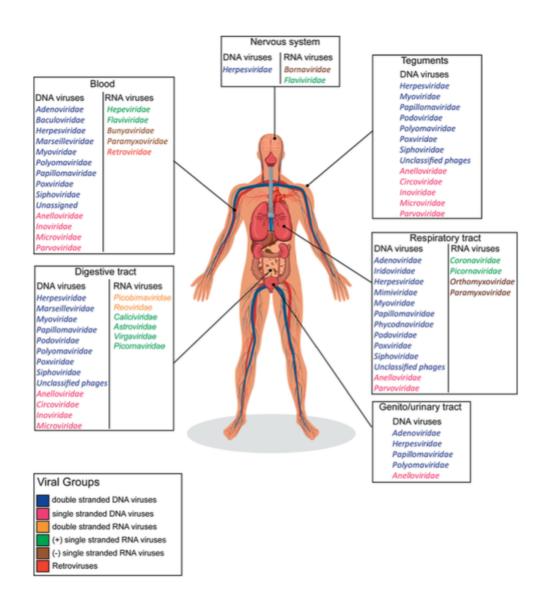

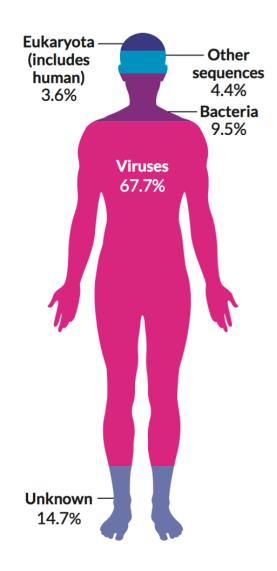

Microbiome

Amazingly, the vast majority of the viruses that infect us have little or no impact on our health or well being

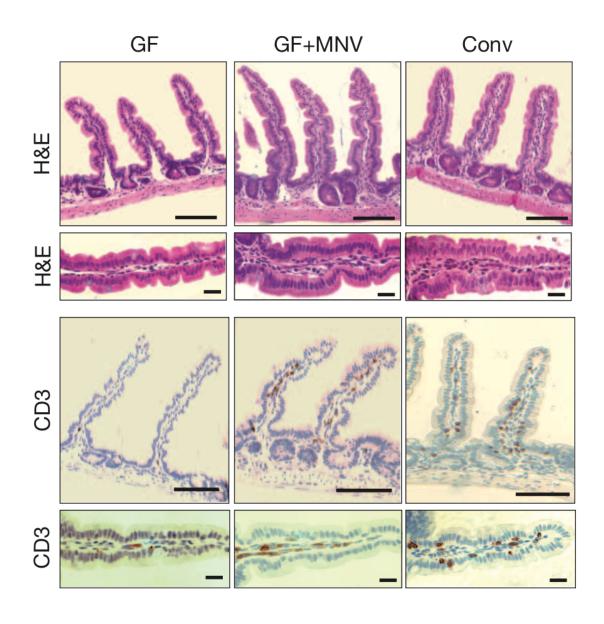

Not all viruses make you sick...

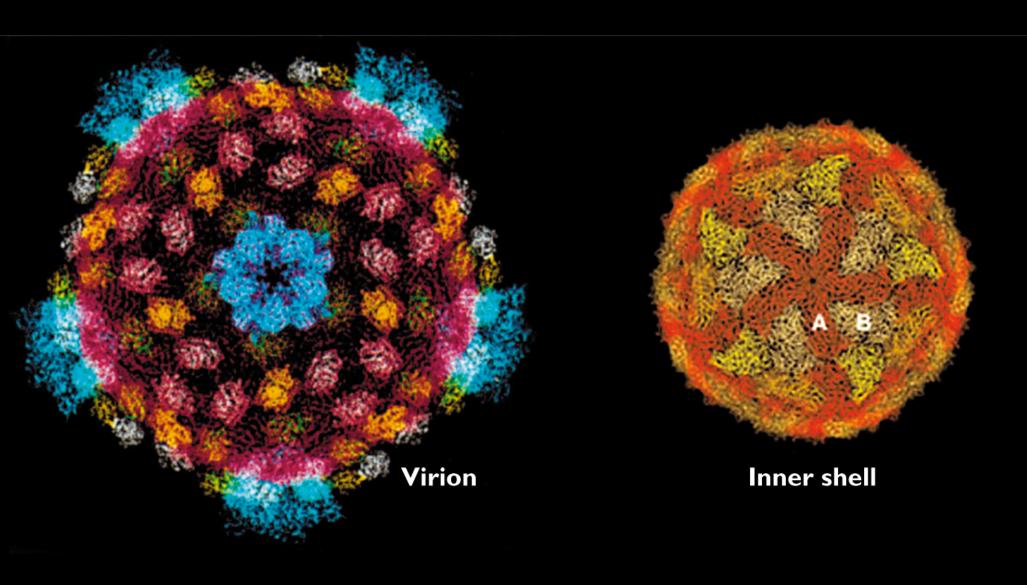

The good viruses

An enteric virus can replace the beneficial function of commensal bacteria

Viruses are amazing

Virology is an integrative science

Course goals

- •This course is designed to help you see the 'big picture' of virology
- •I'll show you how to think about virology as an integrative discipline, not an isolated collection of viruses, diseases, or genes
- •You will learn the fundamentals about these molecular wizards that amaze the informed and *frighten the uninformed*

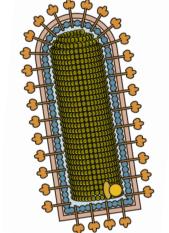

Go to:

m.socrative.com room number: virus

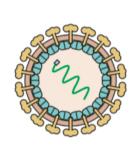

Which statement is true?

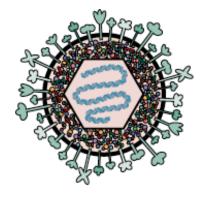

- 1. All viruses make us sick and can be lethal
- 2. Our immune system can manage most viral infections
- 3. Humans are usually infected with one virus at a time
- 4. The press is usually correct in their virology reporting
- 5. Our immune system cannot handle most viral infections

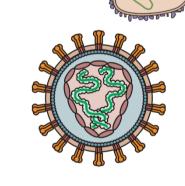

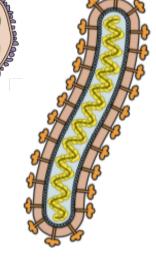

What is a virus?

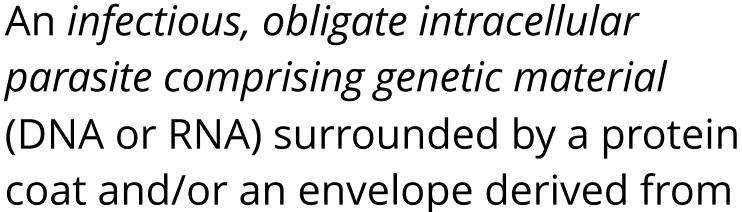

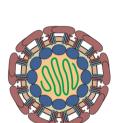

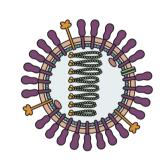

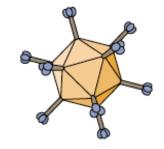

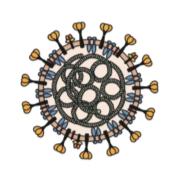

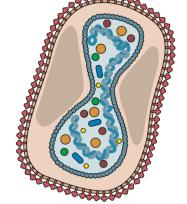

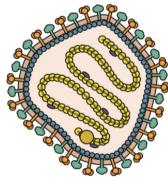

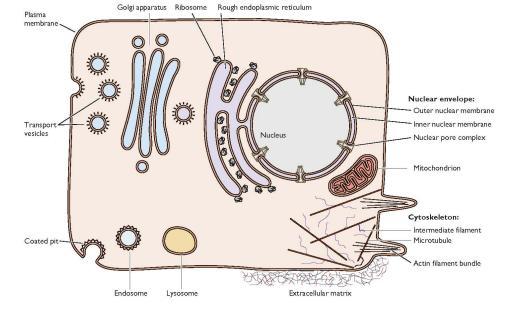

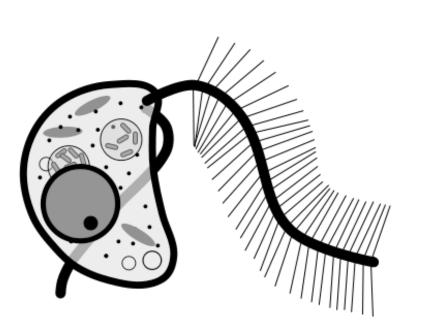

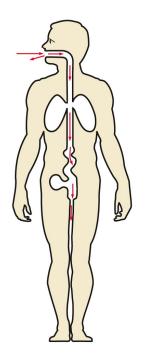

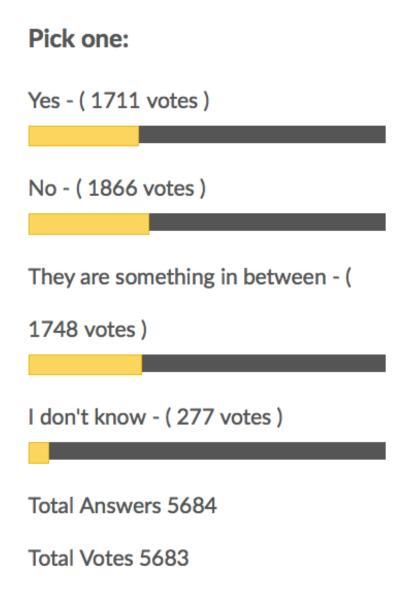

As virions are obligate molecular parasites, every solution must reveal something about the host as well as the virus

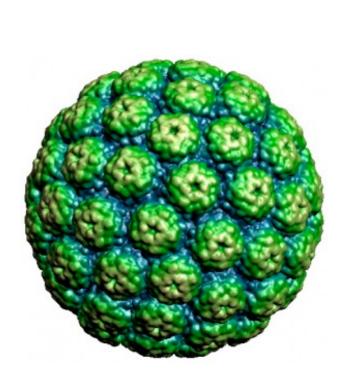

Are viruses alive?

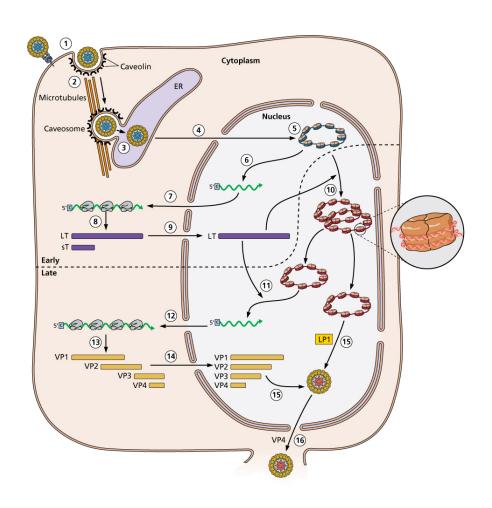

http://www.virology.ws/are-viruses-alive/

The virus and the virion

A virus is an organism with two phases

infected cell

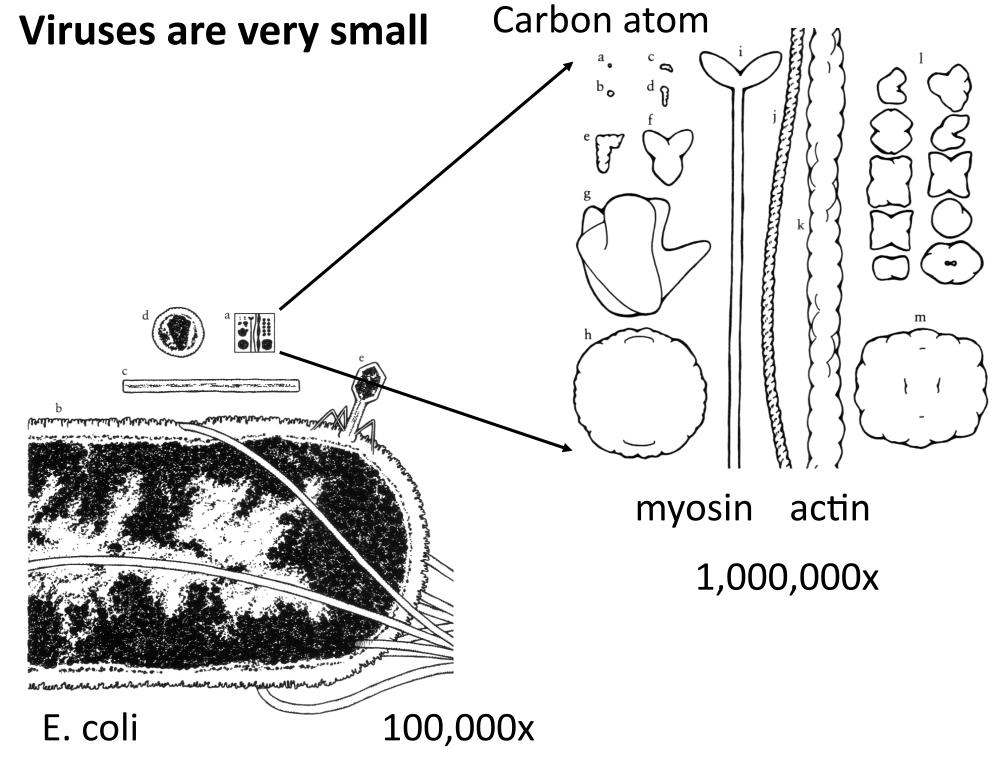

©Principles of Virology, ASM Press

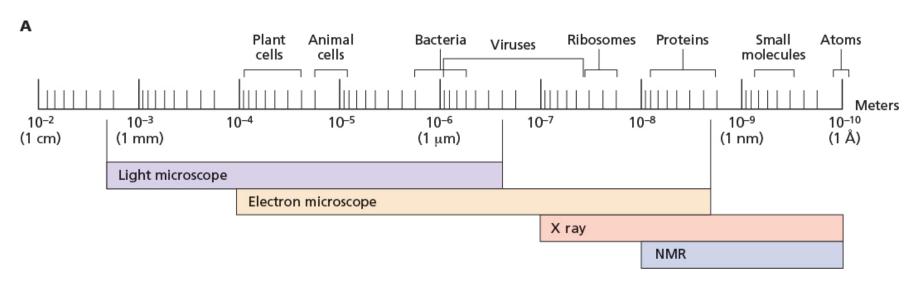

Be careful: Avoid anthropomorphic analyses

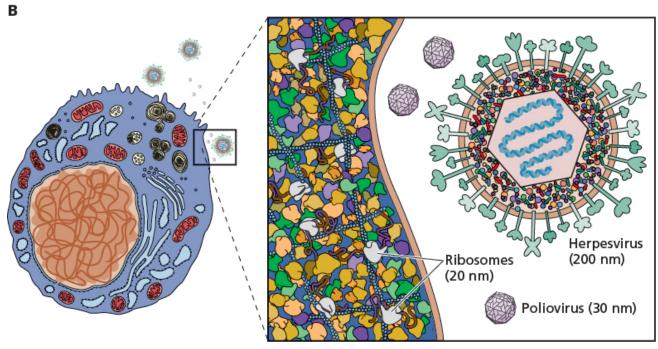

Viruses do NOT think! (or employ, ensure, exhibit, display, etc...)

They do not achieve their goals in a human-centered manner

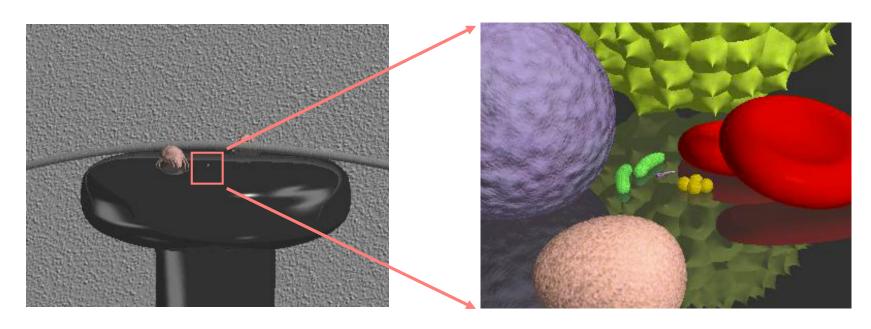

Viruses are passive agents!

How many viruses can fit on the head of a pin?

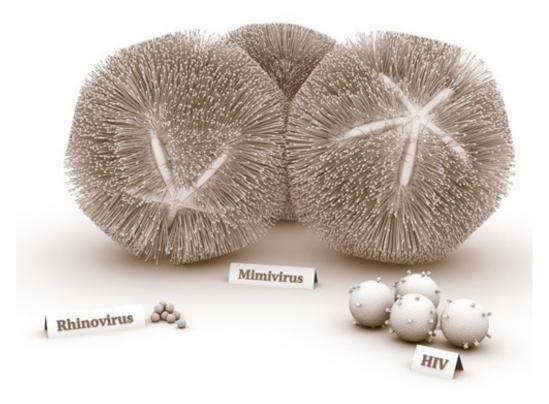

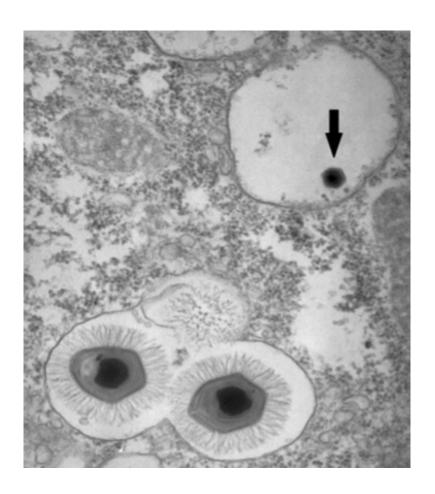

2 mm = 2000 microns

- 500 million rhinoviruses
- When you sneeze, you fire an aerosol that contains enough viruses to infect thousands

Not as small as we once thought!

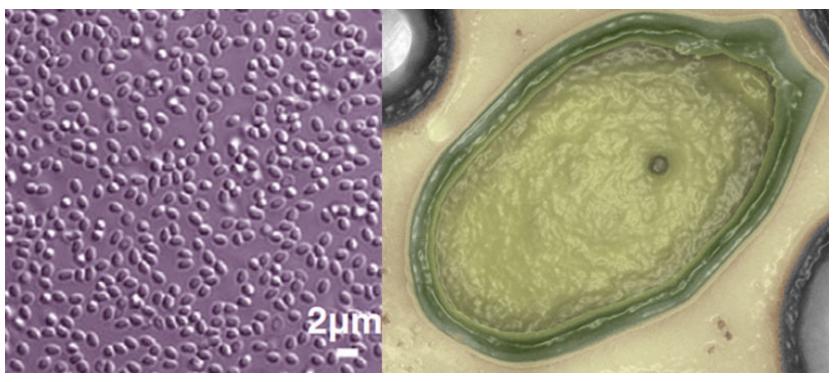

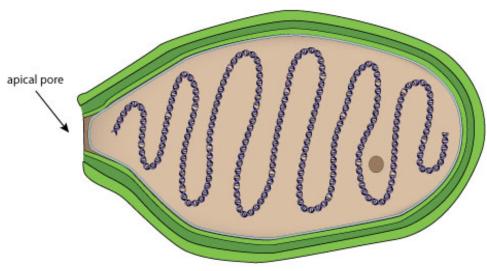

Pandoravirus

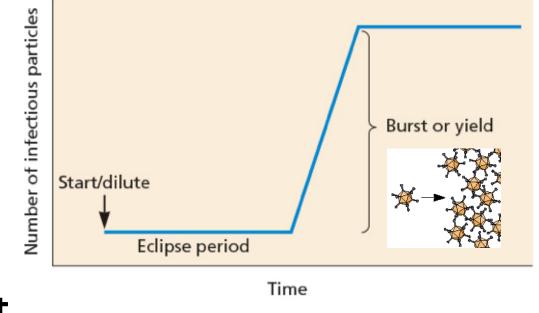

© ViralZone 2014 SIB Swiss Institute of Bioinformatics

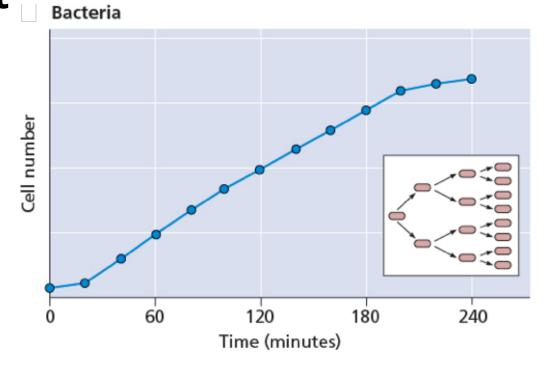

Viruses replicate by assembly of preformed components into many particles

Make the parts, assemble the final product

All cells infected

©Principles of Virology, ASM Press

Go to:

m.socrative.com room number: virus

Which of the following is true concerning bacterial vs. viral replication?

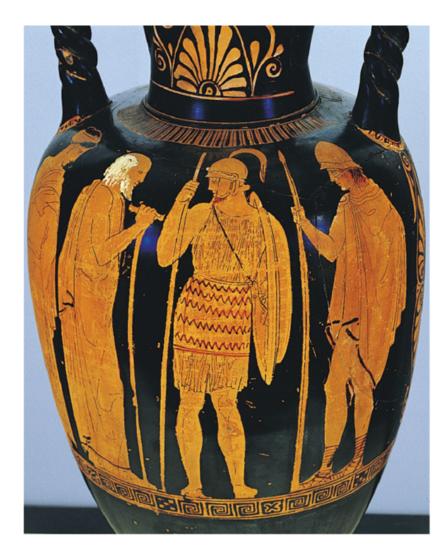

- 1. Viruses must assemble using pre-formed components
- 2. Bacteria do not replicate via binary fission as viruses do
- 3. Bacteria must assemble using pre-formed components
- 4. Viruses do not have an "eclipse" period
- 5. Viruses replicate by binary fission

How old are viruses?

- Estimates of molecular evolution place some viruses among the dinosaurs
- Likely originated billions of years ago before cells?

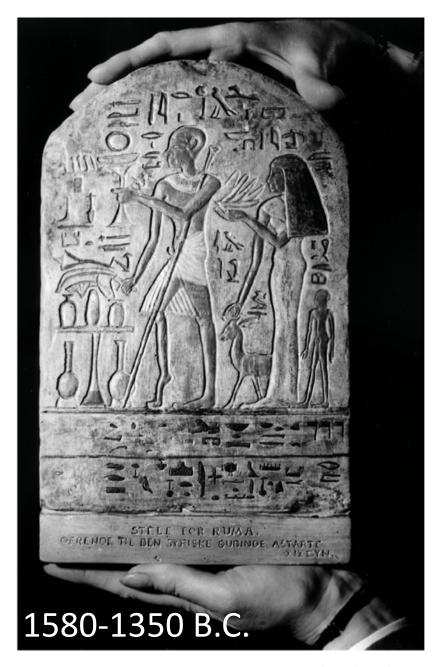

Ancient references to viral diseases

Here this firebrand, rabid Hector, leads the charge.

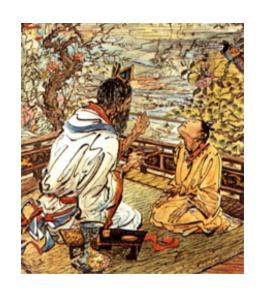

700 B.C.

Homer, *The Iliad*, translated by Robert Fagels (Viking Penguin)

Immunization

- Variolation China (11th century), Lady Montagu (1700s)
- No knowledge of agent
- Survivors of smallpox protected against disease
- 1790s experiments by Edward Jenner in England establish vaccination

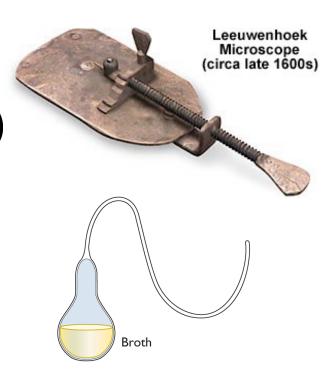

Concept of microorganisms

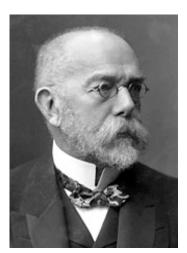

• Leeuwenhoek (1632 - 1723)

- Pasteur (1822 1895)
- Koch (1843-1910)

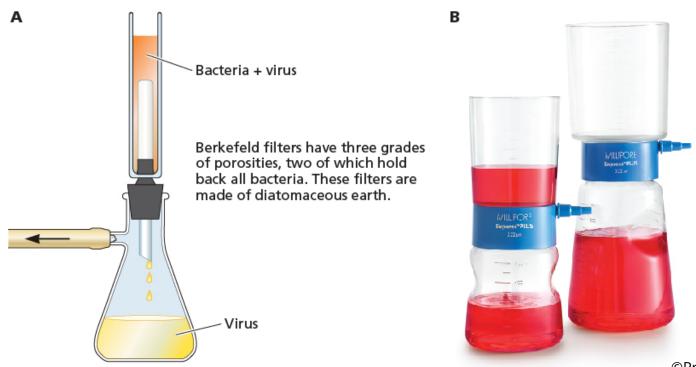

Virus discovery - filterable agents

- 1892 Ivanovsky
- 1898 Beijerinck: contagium vivum fluidum
- Virus: slimy liquid, poison

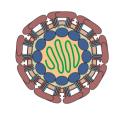

Virus discovery

- 1898 Loeffler & Frosch agent of foot & mouth disease is filterable
- Key concept: agents not only small, but replicate only in the host, not in broth
- 0.2 micron filters (μm, one millionth of a meter)

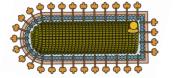

Virus discovery

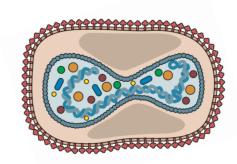

1901 - first human virus, yellow fever virus

• 1903 - rabies virus

1906 - variola virus

1908 - chicken leukemia virus, poliovirus

1911 - Rous sarcoma virus

- 1915 bacteriophages
- 1933 influenza virus

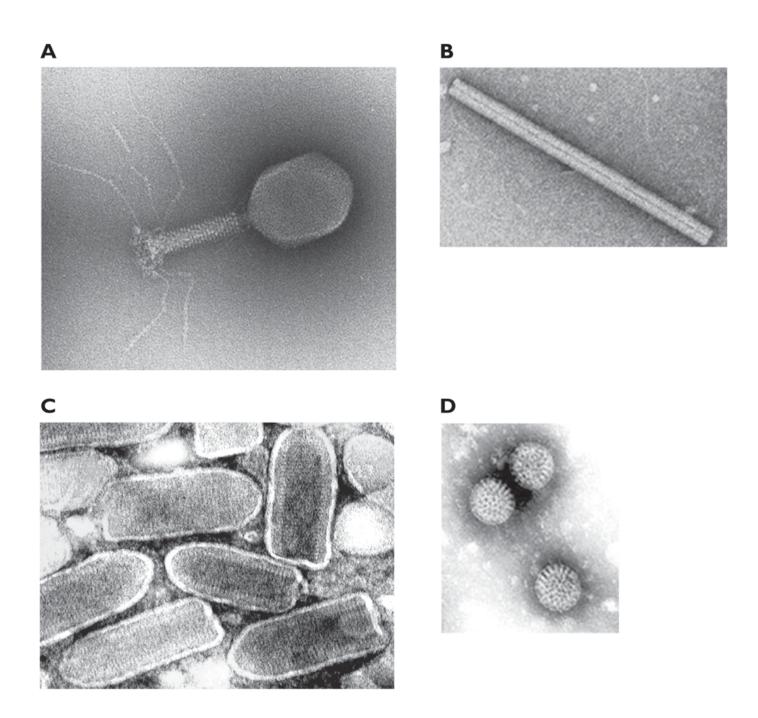

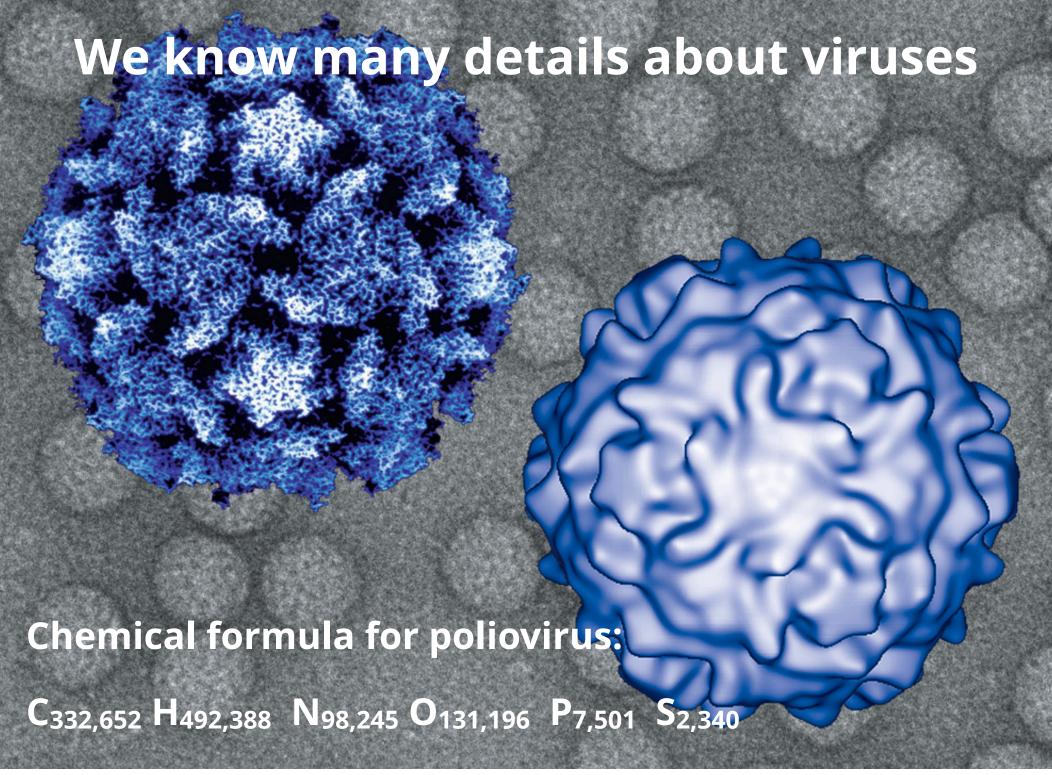

Go to:

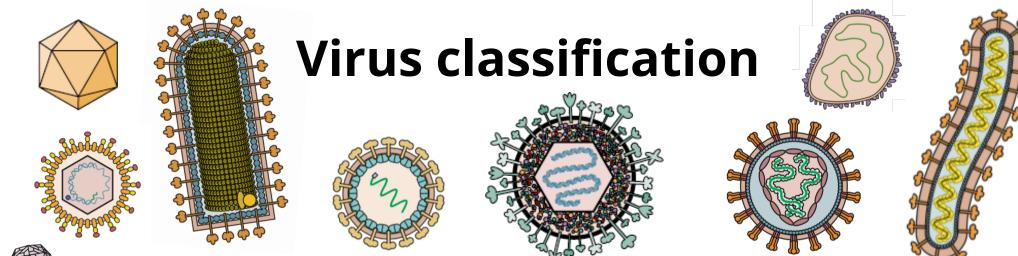

m.socrative.com room number: virus

Which is a key concept first discovered about viruses that distinguished them from other microorganisms?

- 1. They were too large to pass through a 0.2 micron filter
- 2. They could replicate only in broth
- 3. They made tobacco plants sick
- They were small enough to pass through a 0.2 micron filter
- 5. None of the above

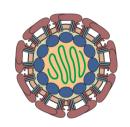

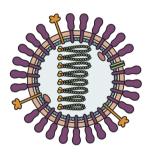

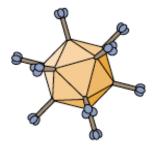

- Nature and sequence of nucleic acid in virion
- Symmetry of protein shell (capsid)

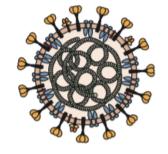

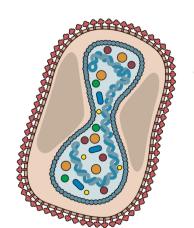

- Presence or absence of lipid membrane (envelope)
- Dimensions of virion & capsid

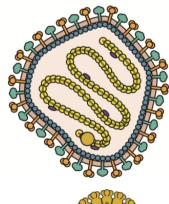

Virus classification

http://ictvonline.org/

Classical hierarchical system:

Kingdom

Phylum

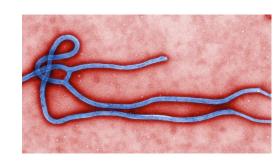

Class

Order (-virales)

Family (-viridae) Filoviridae (filovirus family)

Genus (-virus) Ebolavirus

Species Zaire ebolavirus

Virus discovery

Frigid Antarctica is loaded with viruses

Researchers found nearly 10,000 species by analyzing water samples

A researcher collects freshwater through a hole drilled into the ice covering Limnopolar Lake.

Analyzed DNA from Lake Limnopolar, Antarctica. Found 10,000 species, from 12 different families, some completely new.

http://www.sciencemag.org/content/326/5954/858.long

Why do we care?

- Viruses outnumber cellular life by at least 10:1: the greatest biodiversity on Earth
- Viruses drive global cycles
- Beneficial
- Sources of new pathogens?

There is an underlying simplicity and order to viruses because of two simple facts

- All viral genomes are obligate molecular parasites that can only function after they replicate in a cell
- All viruses must make mRNA that can be translated by host ribosomes: they are all parasites of the host protein synthesis machinery
